                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      CDS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Genes were identified by a combination of several methods: Gene prediction programs including Genscar+ (Chris Burge, http://CCR-081.mit.edu/GENSCAN.html), GeneMarkHWM (Mark Bordovsky, http://genemark.biology.gatech.edu/GeneMark/), GlimmerA (a variant of GlimmerM, see Mihaela Pertea, http://www.tigr.org/softlab/glimmerm_htm/glimmerm.html, and GeneSplicer (Mihaela Pertea and Steven Salzberg, contact mpertea@tigr.org), searches of the complete sequence against a peptide database and the plant EST database at TiGR (http://www.tigr.org/dab/tgi.shtml). Annotated genes are named to indicate the level of evidence for their annotation. Genes with similarity to other proteins are named after the database hits. Genes without significant peptide similarity but with EST similarity, that are predicted by more than two gene proteins genes without proteins. Genes without protein or EST similarity, that are predicted by more than two gene hypothetical proteins Genes most of their length are annotated as hypothetical proteins. Genes mooding tRNAs are predicted by tRNAscan-SE (Sean Eddy, http://genome.washington.edu/RW/Repeatmasker (Arian Smit, http://ftp.genome.washington.edu/RW/Repeatmasker.html).
                                                                                                                                                                       PLN 19-JAN-2001

ALIGNMENTS

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

It may used in the production of transgenic cells which can produce the e acquired resistance protein. Such transgenic plants cells are useful in the production of plants having an increased level of resistance against disease caused by plant pathogens, e.g. bacteria, mycoplasmas, fungi, insects, nematodes, viruses,

resistance, such that the plants have a third level of resistance greater than the sum of the first two levels. The method can be applied to a wide variety of plants (cereals, fruits, oilseeds, vegetables etc.) to protect against viruses, fungi, bacteria, insects and nematodes. The method provides a high level of resistance and allows a reduction in the amount of micobicide used. Since the process involves two different methods of protection, it is unlikely that the pathogen will develop resistance to the treatment.
                                                                                                                                                 ;

This sequence encodes a variant NIM-1 protein from Arabidopsis thaliana. This protein is used in a method resulting in the protection of an immunomodulated plant having a first level of resistance and involves treatment with at least 1 microbicide that confers a second level of resistance, such that the plants have a third level of resistance greater than the sum of the first two levels. The method can be applied to a wide variety of plants (cereals, fruits, oilseeds, vegetables etc.) to protect against viruses, fungi, bacteria, insects and nematodes. The method of micobicide used. Since the process involves two different methods of protection, it is unlikely that the pathogen will develop resistance to

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This cDNA encodes an altered form of the Arabidopsis thaliana non-
inducible immunity-1 (NIM1) protein. Sequences shown in AAV43661 to
AAV43665 represent variants of the NIM1 cDNA. The invention provides a
chimeric gene comprising a promoter active in plants operatively linked
co a DNA molecule that encodes an altered form of the NIM1 protein. Plant
cells stably transformed with a recombinant vector comprising such a
chimeric gene have a broad spectrum of disease resistance. The altered
conting transformed with a netered NIM1 gene exhibits constitutive SAR
copured resistance (SAR) signal transduction pathway. The transgenic
companies transformed with an altered NIM1 gene exhibits constitutive SAR
capteression which is higher in the transformed plants than in a wild type
plant. The products can be used for producing plants with a broad
companies are resistance. Overapression of NIM1 mimics the effects
cof inducer compounds that induce constitutive immunity (CIM) phenotype
cof in plants. The inventions can be used with plants such as rice, wheat,
cof corr, potato, carrot, sweet potato, sugar beet, bean, pea,
chicory, lettuce, cabbage, cauliflower, broccoli, turnip, radish,
construction, aparico, sapplant, pepper, celery, carrot,
squash, pumpkin, zucchini, cucumber, apple, pear, quince, mango, banana, soybean, tobacco,
cherry, placapple, avocado, papaya, mango, banana, soybean, tobacco,
contacto, sorghum and sugarcane. The plants produced are resistant to
copiant pathogens such as viruses, viroids, fungi, bacteria, insects such
as aphids and lepidoptera and nematodes. The plants produced can be used
in agriculture.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This genomic DNA sequence encodes the NIM-1 protein from Arabidopsis thallana. This protein is used in a method resulting in the protection of an immunomodulated plant having a first level of resistance and involves treatment with at least 1 microbicide that confers a second level of resistance, such that the plants have a third level of resistance greater than the sum of the first two levels. The method can be applied to a wide variety of plants (cereals, fruits, oilseeds, vegetables etc.) to protect against viruses, fungl, bacteria, insects and nematodes. The method of microbicide used. Since the process involves two different methods of protection, it is unlikely that the pathogen will develop resistance to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        2814
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           2874

AAV43659
```

This DNA encodes the Arabidopsis thathan non-inductuble immunity in wild-type protein. This DNA can be mutated to produce altered forms of the NIMM protein. The invention provides a chimeric gene comprising a promoter active in plants operatively linked to a DNA molecule that encodes an altered form of the NIMM protein. Plant cells stably transformed with a recombinant vector comprising such a chimeric gene have a broad spectrum of disease resistance. The altered NIMM proteins act as dominant-negative regulators of the systemic acquired resistance (SAR) signal atransduction pathway. The transgenic plants transformed with a natered NIMI gene exhibits constitutive SAR expression which is higher in the transformed plants with a broad spectrum disease resistance. Overexpression of NIMI mimics the effects of inducer compounds that induce constitutive immunity (CIM) phenotype in plants. The inventions can be used with plants such as rice, wheat, barley, rye, corn, potato, carrot, sweet potato, sugar beet, bean, pea, chicory, lettuce, cabbage, cauliflower, broccoli, turnip, radish, spinach, asparagus, onion, garlic, apple, pear, quince, melon, plum, cherry, peach, nectarine, apricot, strawberry, grape, raspberry, blackberry, pineapple, avocado, papaya, mango, banana, soybean, tobacco, tomato, sorghum and sugarcane. The plants produced can be used in agriculture. the Arabidopsis thaliana non-inducible immunity-1 (NIM1)

It may be used to confer a broad spectrum disease resistance in plants, specifically crop plants, e.g. rice, wheat, barley, rye and corn. The NIM1 gene can be used to confer universal disease susceptibility to plant cells, and their progeny. It can also be used in a screening method for identifying compounds capable of inducing broad spectrum

```
This represents the genomic sequence of the Arabidopsis thaliana noninducible immunity-1 (NIM1) gene. The invention provides a chimeric gene comprising a promoter active in plants operatively linked to a DNA molecule that encodes an altered form of the NIM1 protein. Plant cells stably transformed with a recombinant vector comprising such a chimeric gene have a broad spectrum of disease resistance. The altered NIM1 comparison act as dominant-negative regulators of the systemic acquired resistance (SAR) signal transduction pathway. The transgenic plants fransformed with an altered NIM1 gene exhibits constitutive SAR cexpression which is higher in the transformed plants than in a wild-type plant. The products can be used for producing plants with a broad spectrum disease resistance. Overexpression of NIM1 mimics the effects of inducer compounds that induce constitutive immunits with a broad confined compounds that induce constitutive immunity (IMP) phenotype in plants. The inventions can be used with plants such as e.g. rice, wheat, callory, lettuce, cabbage, calliflower, broccoli, turnip, radish, spinach, asparagus, onlon, gazilic, egyplant, pepper, celery, carrot, squash, pumpkin, zucchini, cucumber, apple, pear, quince, melon, plum, certerny, pacah, nectarine, aprincot, strawberry, grape, rasperry, corn, postab, nectarine, aprincot, strawberry, grape, rasperry, corn, plants, aviroids, fundi, bacteria, insects such as viruses, wincids, fundi, pateria, and lear domardor mandon pateria, and nematods mandon pateria, and nematods mandon pateria, and nematods mandon pateria, and lear domardor mandon pateria, and lear

It may be used to confer a broad spectrum disease resistance in plants, specifically crop plants, e.g. rice, wheat, barley, rye auceptibility to plant cells, and their progeny. It can also be used in a screening method for identifying compounds capable of inducing broad spectrum disease resistance in plants, while the plant cells, and their progeny, can be used to isolate a gene fragment which allows expression of broad spectrum disease resistance in plants, or to incorporate the resistant trait
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               NIM1 gene which allows activation in plant of systemic acquired resistance - useful to confer broad spectrum disease resistance in plants, specifically crop plants, e.g. rice, wheat, barley, rye and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The sequence is that of a 7.5 kb genomic region which contains the acquired resistance gene NPRI. The gene may be used in the production of transgenic cells which can produce the encoded acquired resistance protein. Such transgenic plants cells are useful in the production of plants having an increased level of resistance against disease caused by plant pathogens, e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              298;

This sequence encodes a truncated variant NIM-1 protein from Arabidopsis thaliana. This protein is used in a method resulting in the protection of an immunomodulated plant having a first level of resistance and involves treatment with at least 1 microbicide that confers a second level of resistance, such that the plants have a third level of resistance greater than the sum of the first two levels. The method can be applied to a wide variety of plants (cereals, fruits, oilseeds, vegetables etc.) to protect provides a high level of resistance and allows a reduction in the amount of micobicide used. Since the parhoses involves two different methods of protection, it is unlikely that the pathogen will develop resistance to
